RQs

RQ1: How Large Language Models (LLMs) can assist marine missions?

RQ2: What is meaningful generative plans/scenarios using LLMs?

RQ3: What are the possible challenges and limitations of using LLMs to generate plans in terms of reliability?

Proposed approach

Objectives

Research Qestions

Research Steps

Research Steps

- Extracting competence data using Incident Response Plan (IRP) from past successful/ failure marine missions
- Designing different Natural Language Processing (NLP) tasks, such as Text Classification, Named Entity Recognition, Question/ Answering, so on
- Data cleaning from competence data and creating open-source training and evaluating data
- Evaluating generated retrospective plans and procedures using information retrieval metrics
- Utilizing NLP evaluation methods in various Question/Answering task such as Reading Comprehension (RC), Natural Yes and No Questions(BoolQ), Question-answering NLI (QNLI) or Question-answering entailment
- Generating new successful scenarios from those competence knowledge base

FAULT ASSESSMENT AND ESTIMATED PROBABILITY OF LOSS UNDER ICE SHELF FOR AUTOSUB3

DERIVED FROM PERFORMANCE ON
DISCOVERY 29ST JULY 2005, TERSCHELLING MAY 2006, DISCOVERY 306
JUNE-JULY 2006 AND TERSCHELLING JULY 2006,
FORMING STEPS 2 AND 3 OF THE RISK MANAGEMENT PROCESS-AUV.

Gwyn Griffiths
National Oceanography Centre, Southampton. E: gwg@noc.soton.ac.uk T: 023 80596004

Based on mission fault information supplied by Steven McPhail

Mission	Distance (km)	No. Faults	Faults HBU?	Comment
401	7.5	2	N	1. Configuration Minute. ADCP up was configured as a downcast looking ADCP causing navigation problems as the sub was tracking sea surface as the reference. This velocity data was very noisy and put the vehicle navigation out by a factor of 1.5. 2. Damaged on recovery, "moderately serious" to sternplane. Discussed by PST as cause of sternplane actuator failure on m402.
402	254	5	Y (1) and possibly 3	1. Stern Plane stuck up during attempt to dive, 31 20s into mission. Stern plane actuator had flooded. HBU. 2. Allowed due to no/lowdown. Affect where could not communicate with the Depth control mode for period of 40s seconds. Possibly side-effect of actuator or motor problem. HBU. 3. Motor windings had resistance of 330ohms to case. Propeller speed dropping off gradually during a dive. Possibly HBU. 4. Only one position fix from till mounted ARGOS transmitter. 5. GPS antenna damaged on recovery.
403	140	3	Y as 14	1. Recovery light line was wrapped around the propeller on surface. Flaps covering the main recovery lines (and where the light line was towed) were open. Cam is a fairly HBU submarine. 2. Took over 1 hour to get GPS fix at final waypoint. GPS connection was lost at all related to damage to GPS antenna on m402? 3. Propeller speed showed some problems as before. Subsequent testing of motor with Megger showed resistance of a few kOhms between windings.
404	35	7	Possible (1)	1. Pre-launch, float weights could not be successfully loaded due to distorted keeper. "If not spooled, could have dropped out during mission" Considered low probability of distortion and not checked. 2. Pre-launch. Potential short circuit in motor controller that could stop motor. 3. Propeller speed showed some problems as before. Possible HBU. 4. CTD drop-out of 1 hour (shorter drop-outs noted in previous missions). 5. M404 recovery was complicated when lifting lines and connecting lines became trapped on the rudders (probably stuck on the Boles where the two were attached). Recovery from the situation required the trapped lifting lines (attached arms of the ship, attached to the genny lines, and the caught and cut. 6. The forward sternplane was lost due to lifting line snagging between the fin and its cap. 7. The Starboard stern transducer was damaged due to collision with the ship.

QA1

QA2

Answer: 57 – 87%

Question: what is the pessimistic estimation for probability of vehicle loss when there is no fast ice present?

The fault history of Autosub3 during its 2005 and 2006 engineering trials campaigns are analysed to provide an estimate of the probability of loss if used on a campaign of under ice missions proposed by Dr A Jenkins (BAS). Dr Jenkins' requirement (Annex A) forms Step 2 of the Risk Assessment Process-AUV (RMP-AUV); this analysis is Step 3. The responsible owner has yet to declare their acceptable risk (Step 1). Based on four different analysis methods, we estimate that for Dr Jenkins' minimum requirements, and no fast ice present, the optimistic probability of loss to be between 35 and 53% (pessimistic estimate is 57 – 87% [A]). For his full requirements the optimistic estimate lies between 57 – 88% (the pessimistic between 85 – 97%). The probability of loss is increased in the vehicle would need to traverse under fast sea ice to reach the ice shelf.

Answer: 85 – 97%

Question: what is the pessimistic estimation for probability of vehicle loss when we analyze with Jenkin's full requirements?

The fault history of Autosub3 during its 2005 and 2006 engineering trials campaigns are analysed to provide an estimate of the probability of loss if used on a campaign of under ice missions proposed by Dr A Jenkins (BAS). Dr Jenkins' requirement (Annex A) forms Step 2 of the Risk Assessment Process-AUV (RMP-AUV); this analysis is Step 3. The responsible owner has yet to declare their acceptable risk (Step 1). Based on four different analysis methods, we estimate that for Dr Jenkins' minimum requirements, and no fast ice present, the optimistic probability of loss to be between 35 and 53% (pessimistic estimate is 57 – 87%). For his full requirements the optimistic estimate lies between 57 – 88% (the pessimistic between 85 – 97% [A]). The probability of loss is increased in the vehicle would need to traverse under fast sea ice to reach the ice shelf.

QA2

Answer: Weibull distribution

Question: how to assess fault history for a mission? demonstrate using statistics.

Griffiths et al. (2003) showed that, over a sample of 240 Autosub missions, the fault history could be represented by a Weibull distribution ^A. If that is also the case over these fewer missions, we can use this method to estimate probability of loss based on mission length as well as the number of missions. For the combined trials, Figure 3 shows the optimistic assessment (left) and the pessimistic assessment with the 'possible' HIU faults included. Note that the

Answer: mission length

Question: what is the most important factor to assess fault history for a mission?

Griffiths et al. (2003) showed that, over a sample of 240 Autosub missions, the fault history could be represented by a Weibull distribution. If that is also the case over these fewer missions, we can use this method to estimate probability of loss based on mission length ^A as well as the number of missions. For the combined trials, Figure 3 shows the optimistic assessment (left) and the pessimistic assessment with the 'possible' HIU faults included. Note that the Weibull distribution estimate is, in each case, to the right of the lines showing the actual HIU fault history. This is because of the censored data, that is, those missions that did not suffer a HIU fault. Their inclusion tends to increase the probability of survival over any set distance. Unfortunately, due to the very small sample, there are large confidence limits on the parameters of the Weibull distribution (alpha and beta), Table 6.

Answer: mission length

Question: what is the most important factor to assess fault history for a mission?

Griffiths et al. (2003) showed that, over a sample of 240 Autosub missions, the fault history could be represented by a Weibull distribution. If that is also the case over these fewer missions, we can use this method to estimate probability of loss based on **mission length** A as well as the number of missions. For the combined trials, Figure 3 shows the optimistic assessment (left) and the pessimistic assessment with the 'possible' HIU faults included. Note that the Weibull distribution estimate is, in each case, to the right of the lines showing the actual HIU fault history. This is because of the censored data, that is, those missions that did not suffer a HIU fault. Their inclusion tends to increase the probability of survival over any set distance. Unfortunately, due to the very small sample, there are large confidence limits on the parameters of the Weibull distribution (alpha and beta), Table 6.

Answer: Weibull distribution

Question: how to assess fault history for a mission? demonstrate using statistics.

Griffiths et al. (2003) showed that, over a sample of 240 Autosub missions, the fault history could be represented by a

Weibull distribution A

. If that is also the case over these fewer missions, we can use this method to estimate probability of loss based on mission length as well as the number of missions. For the combined trials, Figure 3 shows the optimistic assessment (left) and the pessimistic assessment with the 'possible' HIU faults included. Note that the

What is LLMs and how it works?

Ivan Petrovich Pavlov PERSON Russian NORP Ива́н Петро́вич Па́влов PERSON 26 September 1849 – 27 February 1936 DATE) was Russian NORP physiologist known primarily for his work in classical conditioning . From his childhood Pavlov PERSON demonstrated intellectual curiosity along with an unusual energy which he referred to as " the instinct for research " . Inspired by the progressive ideas D . I . Pisarev PERSON , the most eminent of Russian NORP literary critics the 1860s DATE , I . M . Sechenov PERSON , the father Russian NORP physiology , were spreading Pavlov PERSON abandoned his religious career and devoted his life to science . 1870 DATE , he enrolled in the physics and mathematics department the University of Saint Petersburg ORG in order to study natural science . Pavlov PERSON the Nobel Prize for Physiology or Medicine WORK_OF_ART 1904 DATE , becoming Russian NORP Nobel laureate . A survey the Review of General Psychology WORK_OF_ART , published 2002 DATE , Pavlov PERSON as 24th ORDINAL most cited psychologist the 20th century DATE Pavlov's PERSON principles of classical conditioning have been found to operate across a variety of behavior therapies and in experimental and clinical settings , such as educational classrooms and even reducing phobias with systematic desensitization .

Conclusion & Future Work

Conclusion

Future Work

Conclusion

Reading and Summarising massive reports is exhaustive

Using LLMs, we can summarise, analysis and respond questions from collected report faster

According to PSA regulations, using new risk definition is necessity, we need to shift our horizon to solve probabilistic planning

Conclusion & Future Work

Conclusion

Future Work

In Progress work

Data Collection and Cleaning

Having end-to-end workflow from reading data to responding questions

Future Work

Other Data types extractions, e.g. charts, plots, tables

finding meaningful relation between textual content and other data types
